

SIP Trunks

Connect Your Phone Solution & Internet Services

Use the Internet to Power Your Communications & Say Goodbye to Costly, Low-Quality Land Lines

What are SIP trunks?

A SIP trunk essentially acts as a connection between your business phone solution and your Internet Service Provider (ISP). By adding SIP trunks to a SIP-capable telephony solution, businesses can leverage the powerful features and cost-saving benefits from using the Internet for voice calls, rather than the very costly and less-flexible traditional land lines. Bring your on-premises solution into a new era of communications with ESI SIP Trunks.

Reduce Your Communication Costs

- Cost-effective connections by using your existing high-speed Internet services.
- Enjoy lower operational and capital expenditures.
- The savings from adopting SIP can often finance new solution upgrades.

Flexible & Scalable

- Compatible with the ESI eSIP Evolution Series™ or your existing on-premises telephony solution.
- Purchase as few as two lines and expand as your business and solutions needs grow.
- Great entry point to future Cloud telephony services and solutions.

High-Quality, Reliable Service

- Dependable, high-quality, & consistent service.
- Consolidate your voice & data resources to reduce your management overhead.
- Keep your voice services in the event of a disaster – with multi-location systems, SIP reroutes traffic to another location.
